PRODUCT UPDATE · AUGUST 2026

# The Parameter Set Is Finalized

The measurement layer of Aura Clarus is locked — 519 health parameters, confirmed, grouped, and frozen for the platform.

# The Milestone

This month we finalised the full set of parameters Aura Clarus will measure and present — a foundation that has to be fixed before everything above it can be built with confidence.

**519 parameters, all confirmed.** The list is fixed, the categories are set, and the full breakdown will follow once it is ready to be shared.

# 519 parameters, confirmed

We have finalised every parameter the platform will surface. There are 519 in total, and each one is defined, reviewed and locked for this release.

CONFIRMATION OF THE PARAMETER SET

519 / 519 · 100%

## Why this matters

The parameter set is the foundation everything else is built on. It defines what the sensors must capture, what the data pipeline must store, what the models are trained to produce, and what a person ultimately sees in the app. Until the set was fixed, every layer above it was provisional. With all 519 now confirmed, the hardware, the backend and the applications are building against one stable target.

## What is now fixed

- The **complete list** of parameters the platform will surface.
- The **definition** of each parameter — what it is and how it is derived.
- The **domains** the parameters are grouped into for storage and display.
- The **scope boundary** for the first release: what is in, and what is deferred.

# How each one was confirmed

"Confirmed" is a specific bar, not a rough count. A parameter only entered the final set once it had cleared each of these five checks.

---

1 **Defined** Meaning

A clear, unambiguous description of what the parameter represents, in what unit, and at what resolution.

---

2 **Derivable** Signal path

A known path from the device's raw signals to the parameter, so it can actually be produced from real data rather than assumed.

---

3 **Owned** Placement

Assigned to a measurement domain, so it has a defined place in the data model and in the interface.

---

4 **Reviewed** Distinct

Checked for duplication and overlap, so the set is 519 distinct parameters rather than 519 labels.

---

5 **Frozen** Committed

Accepted into the release scope and closed to further change for this version, so downstream teams can commit.

---

# Inside the Set

The 519 parameters are not a flat list. They are organised into measurement domains and flow through a single, well-defined pipeline — from raw signal all the way to what appears in the app.

**Structured, not scattered.** Every parameter has a domain, a derivation path, and a place in the product.

# Grouped into measurement domains

The parameters are grouped into domains so related signals are stored, modelled and displayed together. The domains below are described at a high level; exact parameters and per-domain counts remain confidential.

|                              |           |                                |           |
|------------------------------|-----------|--------------------------------|-----------|
| <b>Cardiac</b>               | CONFIRMED | <b>Heart-rate variability</b>  | CONFIRMED |
| <b>Respiratory</b>           | CONFIRMED | <b>Oxygenation</b>             | CONFIRMED |
| <b>Thermal</b>               | CONFIRMED | <b>Electrodermal</b>           | CONFIRMED |
| <b>Sleep</b>                 | CONFIRMED | <b>Activity &amp; movement</b> | CONFIRMED |
| <b>Stress &amp; recovery</b> | CONFIRMED | <b>Derived &amp; composite</b> | CONFIRMED |

## From signal to parameter

ILLUSTRATIVE, NOT THE FULL BREAKDOWN

The domains shown here describe the shape of the set at a high level — indicative groupings, not the complete taxonomy or an ordered list. The detailed parameter list and the count within each domain remain confidential for now.

# What stays private, and what we can say

We are confirming the milestone publicly, but holding the detailed list back deliberately. This is a considered decision, not an omission.

## What we are protecting

- The specific parameters and how they are derived are a meaningful part of the product's engineering, and are commercially sensitive ahead of launch.
- Publishing the full set before validation is complete would risk putting out numbers we are still confirming for accuracy.
- Aura Clarus works with health and physiological data, which we treat as sensitive by default and disclose carefully.

## What we can say today

|                   |                                       |
|-------------------|---------------------------------------|
| Total parameters  | 519, confirmed                        |
| Set status        | Finalised and frozen for this release |
| Organisation      | Grouped into measurement domains      |
| Detailed list     | Confidential — to be published later  |
| Per-domain counts | Confidential for now                  |

# What we will share, and when

The full detail is coming. We will release it in stages, so that what we publish is accurate, clear and safe to share. These stages track the product's validation and beta timeline.

|                                                                                   |                                                                                   |                                                                                   |                                                                                     |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  |  |  |  |
| NOW                                                                               | NEXT                                                                              | THEN                                                                              | EVENTUALLY                                                                          |
| <b>The milestone</b>                                                              | <b>Domain overview</b>                                                            | <b>Progressive detail</b>                                                         | <b>Full specification</b>                                                           |
| 519 parameters confirmed and grouped into domains.                                | A public view of the domains and the insight each supports.                       | Parameters disclosed as they clear validation, with the beta.                     | The complete, documented parameter list, published in full.                         |

TIMING

These stages follow validation and beta progress rather than fixed calendar dates. As each set of parameters clears review, the corresponding detail is shared, and this update will be revised as that happens.

## In summary

The measurement layer of Aura Clarus is defined. 519 health parameters are confirmed, organised into domains, and frozen for this release — with the full list being prepared for publication as validation completes.
