

INFRASTRUCTURE UPDATE · AUGUST 2026

Our Backend, Now on AWS

We have selected Amazon Web Services as our backend cloud partner — with all formalities complete and the parameter backend already processing there.

PREPARED FOR	AREA	STATUS
Product & Stakeholders	Backend infrastructure	Confidential

The Decision

With the parameter set finalised, the backend that powers it needs a home built to scale. We have chosen AWS as that home — and the paperwork to get there is done.

AWS is our cloud backbone. Chosen, formalised, and already running the parameter backend.

AWS is our backend cloud partner

The backend for all of the confirmed parameters is being processed on AWS. We have decided that our backend cloud partner will be Amazon Web Services, and all the formalities for that are complete.

FORMALITIES COMPLETE

What is confirmed

- **Partner selected.** AWS is our chosen backend cloud provider.
- **Formalities complete.** The account and commercial setup are in place.
- **Backend live on AWS.** The parameter backend is being processed there now.
- **One home.** A single, consistent platform for the data behind the product.

Why AWS

The backend handles sensitive health data at scale, so the platform underneath it has to be dependable from day one. AWS was chosen for four reasons.

1 **Scale** Growth-ready

Capacity that grows with usage, so the backend can move from beta to many users without re-platforming.

2 **Security** Sensitive data

Enterprise-grade controls suited to handling health and physiological data responsibly.

3 **Reliability** Uptime

A mature, proven platform with the availability a health product needs to be trusted.

4 **Managed services** Lean team

Managed building blocks reduce operational load, so a small team spends its time on the product rather than on infrastructure.

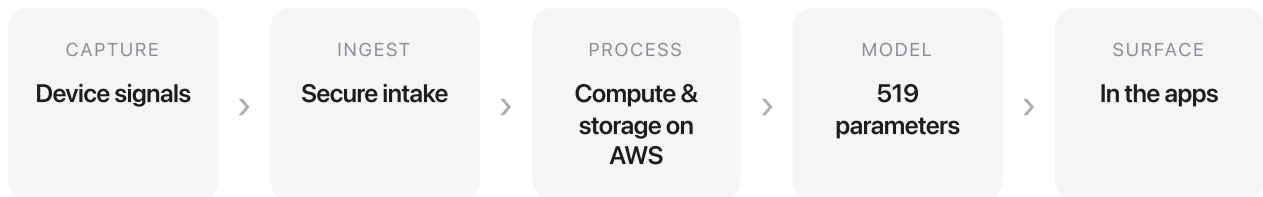

Under the Hood

At a high level, data moves along a single path — from the device, through secure processing and storage on AWS, into the models, and back out to the apps.

One path, end to end. Device to insight, with AWS as the backbone in the middle.

How the backend is structured

A conceptual view of the flow. The device captures signals; AWS handles secure ingestion, processing and storage; the models turn data into parameters; and the apps present the result.

What runs on AWS

- Secure ingestion of device and physiological data.
- Processing and storage for the confirmed parameter set.
- The model and data pipeline that turns raw signals into parameters.
- The services the iOS, macOS and upcoming apps talk to.

CONCEPTUAL OVERVIEW

This describes the shape of the backend at a high level. Specific services and the detailed architecture are managed internally and are not part of this update.

Where things stand

The decision is made and the groundwork is laid. From here, the focus is building out and hardening the backend as the beta approaches.

Cloud partner	Amazon Web Services (AWS)
Formalities	Complete
Backend	Parameter backend processing on AWS
Scope	All 519 confirmed parameters
Detailed architecture	Managed internally — not shared

In summary

Aura Clarus now has a committed cloud backbone. AWS is our backend partner, the formalities are done, and the parameter backend is already running there — a foundation ready to scale as we move toward beta and beyond.

IBT AURA PRIVATE LIMITED

A backbone built to scale.

Aura Clarus — wearable health intelligence. Proactive, preventive,
and designed for real lives.
