Corporate & Ownership

This month we formalized our cap table and brought real clarity to how the company is owned and led. Establishing ownership and governance now, before the seed round rather than in the middle of it, means the company enters fundraising with a transparent, well-defined structure that gives incoming investors confidence in exactly how the company is held and who is accountable for what. Investors can see precisely how the company is owned with no ambiguity left to resolve under deal pressure.

Alongside formalizing the cap table, we simplified governance. Midhuna Archaa has stepped down from her director position while retaining her 24.79% shareholding. This removes complexity from day-to-day decision-making and concentrates operational leadership in a small, aligned core. Going forward, the company is led by Vishwanath Kannan as Chief Executive Officer and Adithisri Vishwanath as Chief Operating Officer, supported by Megavarnan Govindaswamy as advisor. It is a deliberately lean leadership structure that allows few people, clear ownership of outcomes, and fast decisions, which is exactly the shape a company at our stage needs to move with conviction. Founders hold a combined 67% and clear control of direction, with advisory and early-stakeholder holdings modest and well-defined, ready to accommodate new investment without renegotiating what already exists.

SHAREHOLDER	STAKE
Vishwanath Kannan Founder & CEO	40.00%
Adithisri Vishwanath Co-Founder & COO	27.00%
Midhuna Archaa Shareholder	24.79%
Megavarnan Govindaswamy Advisor	5.21%
ITNT Shareholder	3.00%
Total	100.00%

Financial Projection

We completed a full 21-month financial projection and profit-and-loss model running from July 2026 through March 2028, giving us a rigorous, month-by-month picture of the journey from pre-launch through to a sustainable, growing business. The model maps out the entire cost structure from prototype development and certification through batch manufacturing and US market launch, alongside a detailed revenue forecast built on hardware sales and recurring subscription income. Every major assumption behind these numbers, from unit economics and gross margins across manufacturing scales to subscriber conversion rates and monthly churn, is broken out in detail, so the projection functions both as the backbone of our seed fundraising conversation and as a living operating plan that we update against real costs as they come in.

The financial model is built on a \$399 device paired with a \$30 per month subscription, a structure that gives the company two complementary and reinforcing revenue streams from day one. Hardware margin at the point of sale provides immediate return, while recurring software revenue compounds as the user base grows. Unit COGS decline meaningfully across manufacturing batches, from \$186 at 100 units down to \$140 at 500 units, driving gross margin from 53% to nearly 65% as the company scales. The model projects three manufacturing batches across the first year post-launch, each larger than the last, with inventory investment timed to match sell-through so cash is deployed efficiently.

Fundraising

IBT Aura is raising a seed round to fund the journey from a fully designed product to a launched, revenue-generating business. The financial model projects a peak cash requirement of approximately \$145K, which comes at the point of heaviest inventory investment when the third manufacturing batch is ordered in November 2027. A seed round in the range of \$150K to \$200K covers this peak comfortably, carries the company through to monthly profitability in September 2027, and provides working capital as hardware sales and subscription revenue ramp up.

The fundraising infrastructure is now fully in place. Our website at ibtaura.com features a dedicated investor section built around our "We Are Raising" seed round, including a detailed twelve-question Investor FAQ addressing the problem, business model, market opportunity, competitive positioning, data privacy, and risks. The pitch deck is available for download directly from the site, and detailed financial and market documents are accessible on request through a gated process. An early investor is already on board with capital being deployed in tranches, and the cap table has been formalized to ensure a clean, well-governed structure that is easy for incoming investors to diligence and participate in.

The investment thesis is straightforward: Aura Clarus is entering a \$380 billion-plus global wearable health market with a differentiated product that bridges medical-grade accuracy and everyday comfort, backed by a two-stream revenue model that generates margin from day one while building compounding subscription value over time. The product is designed and sourced, the team is lean and focused, and the financial model is detailed and conservative. What capital buys now is speed to market and scale.

SEED ROUND SUMMARY

Target: \$150K to \$200K **Stage:** Pre-launch, product fully designed **Use:** Prototyping, certification, batch manufacturing, US launch **Existing investor:** On board, deploying in tranches

Website

Our website at ibtaura.com is now fully live from end to end, and it has become the single credible home for everything the company is and is building. The site serves three distinct audiences: investors evaluating the opportunity, beta users interested in early access, and press looking for the company story. Each finds what they need in one clean, professional destination, removing the friction that comes from scattered information and incomplete online presence.

The site features complete About and company pages that introduce the leadership team of Vishwanath Kannan as Founder and CEO, Adithisri Vishwanath as Co-Founder and COO, and Megavarnan Govindaswamy as Advisor, alongside a culture section and the company's seven core values. The investor section is anchored by a "We Are Raising" seed-round overview, a detailed twelve-question Investor FAQ covering problem, model, market, privacy, and risk, together with a downloadable pitch deck and gated financial and market documents available on request. Public trust documents including the Incorporation Certificate, GST Certificate, and Import/Export Certificate are posted for transparency.

On the product side, we published dedicated, in-depth pages for both the Aura Clarus mobile app and the Aura Clarus desktop app. The mobile app page presents the AI-first companion experience and the sensor capabilities of the wearable, while the desktop page introduces the desktop experience with early-interest collection ahead of launch. Together these pages give visitors a clear picture of the full product ecosystem and how it follows the user across their day, from wrist to phone to desk.

WHAT IS LIVE

Pages: Home, Aura Clarus App, Aura Clarus Desktop, Articles, About **Investor:** Seed round page, FAQ, pitch deck download, gated docs **Trust:** Incorporation, GST, Import/Export certificates
Deployment: Cloudflare, auto-deploys on push to main

Product Development

AURA CLARUS APP

Mobile experience

The Aura Clarus mobile app has been built out into a genuinely usable experience, with its full set of screens, navigation, and workout flows spanning Outdoor Run, Cycling, Hiking, Gym, and Calisthenics, each adapting intelligently to the activity type. The app is designed around a simple but powerful principle that sets us apart from everything else in the market: rather than burying the user in charts and raw numbers, our AI companion speaks first and tells them what actually matters and what to do about it today. It turns continuous physiological data from the wearable into clear, proactive guidance. The action engine prioritizes what surfaces to the user each morning, sorting by urgency so the most important health insight is always front and center. ECG interval validation logic is in place, ensuring the accuracy of our cardiac health intelligence from the sensor layer all the way through to the user-facing recommendation.

AURA CLARUS DESKTOP

Desktop experience

The Aura Clarus desktop app has entered active development, extending our product ecosystem beyond the wrist and the phone to the desk where so many of our target users, particularly founders, professionals, and health-conscious knowledge workers, spend the majority of their day. The desktop experience is designed to bring the same proactive health intelligence into a workspace-native format, offering deeper views and contextual guidance that take advantage of a larger screen and a longer attention window. Its dedicated page on the website is now live and collecting early interest ahead of launch, building a waitlist of engaged users who want the full cross-device experience from day one.

Together the mobile and desktop apps form the connected software layer at the heart of the Aura Clarus ecosystem, a coherent experience that follows the user across their entire day and consistently translates what their body is telling them into clear, actionable steps.

Hardware

Our hardware reached a defining milestone this month as the PCB completed its Gerber files and became manufacturing-ready on 20 June, formally closing the core electronic design phase and clearing the path to physical production. This is a significant step because it means the electronic design is no longer iterating; it is a finished, production-grade artifact ready to be sent to a fabrication house. Every trace, via, and component footprint has been validated against our design rules, and the board is ready for manufacturing as a proven, released design.

Alongside the PCB, we finalized the V06 bill of materials and locked in component sourcing on 11 July. The BOM retains the proven core of the MDBT53V module built on the nRF5340 processor, the ADS1292R ECG analog front-end, and the TMP117 precision temperature sensor, while optimizing the supporting components for cost, performance, and supply-chain reliability. We swapped the flash memory to the GD25Q64, the accelerometer to the BMI270, and corrected the NPM1100 power management footprint to ensure a clean first-build with no rework needed. Every component has been sourced through LCSC to ensure availability and competitive pricing at prototype and early production quantities.

In parallel, the physical product continued to take shape through CAD work across Fusion 360 and Blender. The titanium CNC housing, the inner plastic structural frame, and the silicone band have all advanced significantly through June and July, with the watch-case undergoing height reduction to achieve a slimmer, more wearable profile. The titanium housing remains the largest single component cost at 44.6% of unit COGS, a deliberate choice driven by our commitment to building a premium product that communicates quality and durability from the moment it is worn. Taken together, these steps mean the hardware is no longer a design exercise but a defined, sourced, and increasingly build-ready system.

HARDWARE STATUS

PCB: Gerber complete, manufacturing-ready **BOM:** V06 finalized, LCSC sourced **Core:** nRF5340 + ADS1292R + TMP117 + BMI270 **Enclosure:** Titanium + plastic frame + silicone band, CAD advancing

Company Operations

Behind the product and the fundraising, we designed and stood up our Company OS, a five-layer automation system built so that a lean team can operate with the reach and consistency of a much larger organization. Each layer has a single clear job, and together they turn scattered manual work into a continuous, organized flow.

1 **Scouts** Intelligence

Ten dedicated agents continuously scout the landscape, surfacing beta leads, potential investors, press opportunities, manufacturing partners, and competitive movements, so the company always has a live, current view of its environment.

2 **Brain** Decisions

A decision layer applies clear rules to what the scouts find. Marketing is fully automated; product decisions stay under human judgment, keeping speed where it helps and control where it counts.

3 **Arms** Action

The operational layer runs outbound email sequences, updates the CRM, schedules follow-ups, and drafts partner outreach, all in the company's own voice and design style.

4 **Memory** Records

A centralized data memory in structured sheets logs every contact, reply, and relationship in one place, giving the company a single source of truth across the investor pipeline, beta users, and manufacturing shortlist.

5 **Brief** Focus

Every morning the system distills everything into one concise executive brief, so each day starts with clarity on what happened, what needs a decision, and what to focus on.

This operating backbone lets us move quickly and stay organized today with limited hands on deck. Just as importantly, it is designed to compound: as the team grows, each new person steps into a structured, automated system rather than into chaos that has to be untangled.

IBT AURA PRIVATE LIMITED

Simple. Transparent. Built to last.

Aura Clarus. Wearable health intelligence. Proactive, preventive, and designed for real lives.
