

COMPANY UPDATE 01 · AUGUST 2026

Backend, finalised.

Every parameter in the catalog now has a working, deployed cloud engine. Read from the live eu-north-1 stack and the real data — nothing here is illustrative.

PREPARED FOR	AREA	STATUS
Product & Stakeholders	Cloud backend	Confidential

The live backend

A single honest picture of what is deployed in AWS today — the resources, the region, and how much real data has flowed through the stack.

630 resources, one region, live. Read from the deployed stack, not a diagram.

THE DEPLOYED STACK

Deployed & healthy

The Aura Clarus backend runs entirely in AWS eu-north-1 (Stockholm), with per-user isolation and a single pipeline that turns one day of raw signals into everything the app shows.

630

AWS RESOURCES

207

LIVE IN THE APP

134

FIELDS ON LATEST DAY

The essentials

- **Region.** eu-north-1 · Stockholm — one region, all resources.
- **Last compute.** 18 August 2026, with 12 days of data stored.
- **Users.** 5 isolated accounts; raw upload $\approx$ 18 MB per user per day.
- **Health.** Stack deployed and healthy — no blocked infrastructure.

THE HEADLINE

Nothing is unbuilt any more. Every parameter in the catalog has a working, deployed cloud engine. What remains is capture and wiring — not computation.

Where every parameter stands

All 374 fields — 341 Search parameters and 33 Tier D insight fields — by status, read from the deployed stack and the real data on the latest day.

What the numbers mean

- **Live.** Flows end-to-end and shows in the app today.
- **In cloud, app not reading.** Computed server-side; only needs the app wired up.
- **Engine built, awaiting capture.** The computation exists; it is waiting on the input signal to be captured.
- **Blocked.** Zero — nothing is held up by a missing feature.

REMOVED ON PURPOSE

38 parameters were removed from the app entirely rather than left showing “No Data” forever — they needed a sensor that does not exist, or would have meant a medical claim. Honesty over a longer list.

The architecture

One endpoint, one pipeline, one region. This is the exact path a single day of your data travels — from the band on your wrist to a graph in the app.

One day of data, end to end. Clients → identity → API
→ compute → storage.

How one day of data travels

Every client calls one GraphQL endpoint; one Lambda runs the whole pipeline; fourteen tables and three buckets hold the result.

The pipeline's 20 modules

A single Lambda, **computeDaily**, runs the whole chain — heart, sleep, stress, movement, focus, meetings, food, mode and phone among them — reading raw signals from S3 and writing scored parameters to DynamoDB. **UserBaselines** carries HRV, sleep and stress history from one day to the next, so scores are personal, not population-based.

Each stage, in detail

Clients

4

iOS & macOS in SwiftUI and Windows in PyQt6 are live. Android (React Native) has no backend yet.

Cognito

5

Email sign-in and per-user isolation across 5 accounts. An identity pool issues temporary AWS credentials for direct S3 upload.

AppSync

123

One GraphQL endpoint every client calls, backed by 123 resolvers — the single front door to the backend.

computeDaily λ

20

Node 20, 1769 MB, running 20 pipeline modules end-to-end for each day of data.

DynamoDB

14

Fourteen tables. DailyMetrics holds 199 columns $\times$ 12 rows; UserBaselines carries history day to day.

S3

3

Three buckets — raw days, profile images and meal photos.

What the app shows

Every value in the app belongs to one of four tiers — from raw sensor readings to a professional ECG/HRV insight layer scored against your own baselines, never population cut-offs.

Four tiers, from sensor to insight. Values below are from the latest real day.

THE FOUR TIERS

From sensor to insight

How a reading becomes an insight — with example values from the latest day of data.

Tier A · measured

Straight from the band's sensors, scored by the pipeline.

steps 10,888 · sleep 62 · HRV 49 ms · recovery 66

Tier B · derived

Composed from Tier A — paces, rolling averages, baselines.

readiness 63

Tier C · five sources

Derived, Logging, Mode, Phone and Food — shipped independently.

wellness 63 · burnout 29

Tier D · professional

An ECG/HRV insight layer, scored against within-person baselines — never population cut-offs.

cognitive load 45 · peak 16:00–19:00 · burnout+ 34

IBT AURA PRIVATE LIMITED

Built. Deployed. Live.

Aura Clarus — wearable health intelligence. Proactive, preventive, and designed for real lives.
